Home control systems add the ability for a user to prioritize their interface the way they want to use it.

This can lead to one of the most significant, although rare, acute adverse effects—a marked rise in body temperature (hyperthermia).. MDMA use in combination with vigorous exercise causes dehydration, leading some people to drink large amounts of liquids.. In addition, combining MDMA with other substances, such as caffeine, amphetamines, the amphetamine-like mephedrone, marijuana, or alcohol, may increase the risk of adverse health effects associated with MDMA.. As a result, additional doses of MDMA can produce unexpectedly high blood levels, which could worsen the toxic effects of this drug.. ©Shutterstock com/ Use of even moderate doses of MDMA in crowded, warm environments—or during periods of vigorous, extended physical activity—can dramatically increase body temperature, with potential deadly consequences.

In the hours after taking the drug, MDMA produces significant reductions in perceiving and predicting motion—for example, the ability to judge whether a driver is in danger of colliding with another car.. Research in rats shows that even moderate doses of MDMA interfere with the body’s ability to regulate temperature, potentially leading to deadly consequences in warm environments.. Treatment of hyperthermia requires prompt medical attention, as it can rapidly lead to muscle breakdown or an electrolyte (sodium) imbalance, which can in turn produce kidney failure or fatal swelling of the brain, especially in women.
